

Bifrost Inventory

An app for Microsoft Dynamics 365 Business Central, on Bifrost Foundation

BIFROST.
INVENTORY

Keep item attributes up to date from other systems and assistants.

Bifrost Inventory lets another system or an AI assistant read and maintain item attributes in Business Central. The results show on the item, under the standard item attributes; the app has no pages of its own. It is an add-on to Bifrost Foundation.

The screenshot displays the Bifrost Inventory app interface within a Microsoft Dynamics 365 Business Central environment. The main header shows the item name '1896-S · ATHENS-skrifborð'. Below this, a navigation bar includes 'Home', 'Request Approval', 'Item' (selected), 'Prices & Discounts', and 'More options'. A secondary bar lists various functions: Attachments, Comments, Marketing Text, Structure, Subscription Packages, Advanced Statistics, Phys. Inventory Ledger Entries, Item Availability by, Items by Location, Substitutions, Approvals, Dimensions, Attributes, and Cost Shares. The main content area is divided into two sections: 'Item' and 'Inventory'. The 'Item' section contains fields for No. (1896-S), Description (ATHENS-skrifborð), Blocked (toggle), Type (Inventory), Base Unit of Measure (STYKKI), Item Category Code (BORD), Variant Mandatory if Ex (Default (No)), and Stockout Warning (Default (Yes)). The 'Inventory' section includes Shelf No., Inventory (510), Qty. on Purch. Order (7), Qty. on Sales Order (7), Unit Volume (1.2), and Over-Receipt Code. On the right, a sidebar titled 'Item Attributes' shows a table with columns 'Attribute' and 'Value'. The table lists attributes like 'Efni (fætur)', 'Stíllanleg hæð', 'Samsetning nauðsynleg', 'Snúrustjórnun', and 'Vottanir' with their respective values. A 'Forecast' section at the bottom of the sidebar notes that AI-generated suggestions may not always be accurate.

Attribute	Value
Efni (fætur)	Fint ryð
Stíllanleg hæð	Nei
Samsetning nauðsynleg	Nei
Snúrustjórnun	Festank
Vottanir	FSC

Forecast
AI generated suggestions may not always be acc

Item attributes kept up to date on the item card.

What it does

- Shows an item's attributes in one go, including the ones that have no value yet.
- Gives an item an attribute value safely: setting the same value again changes nothing, and replacing a value happens only when asked.
- Changes a value and shows it before and after.
- Defines a new attribute, with its option values, before any item uses it.
- Feeds catalogue sync, product information enrichment and master-data work by an assistant.

Who it is for

Companies that keep product information in more than one place, and teams that want an assistant to help enrich and clean item data.
